Batteries

# Why is the battery so crucial for a connected device ?

PROVEN SMART SERVICES  
LOW COST OUTDOOR INTERNET OF THINGS 10+ YEAR LIFE  
SAFE CLOUD LoRa INTELLIGENT SIGFOX PLATFORM  
AUTOMATION ECO DESIGN RELIABLE ROBUST DATA  
BIG DATA POWERFULL WIRELESS MATURE  
AUTONOMOUS NETWORK

**At the heart of every IoT system is POWER**

# Batteries are in Saft's DNA for more than 100 years

## GROUP PROFILE

**100+** years of history

**Leadership position**  
on **75-80%** of revenue base

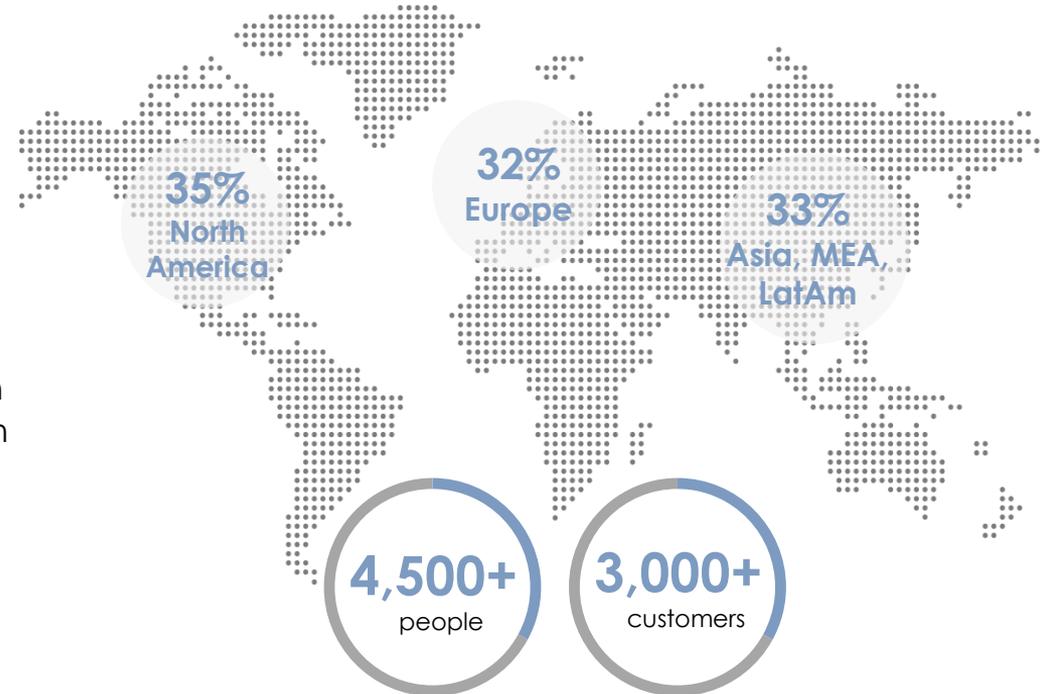

**12.4%** invested in **R&D** with **3** main technologies; primary lithium, lithium-ion & nickel-cadmium

**€796m** revenue FY 2019

## GLOBAL PRESENCE - SALES

# Saft Connected Energy Division

Focus on small primary and rechargeable lithium solutions

40 years of production experience

2 rechargeable chemistries:  
- LiNiMnCoO<sub>2</sub> (NMC)  
- Blend (NMC/NCA)

7 factories

3 brands:  
- Saft  
- Tadiran  
- Eternacell

3 primary lithium chemistries:  
- Li-SOCl<sub>2</sub>  
- Li-MnO<sub>2</sub>  
- Li-SO<sub>2</sub>

Our priority: reliably powering B2B IoT applications

# Saft's Connected Energy for IoT: where to find our solutions ?

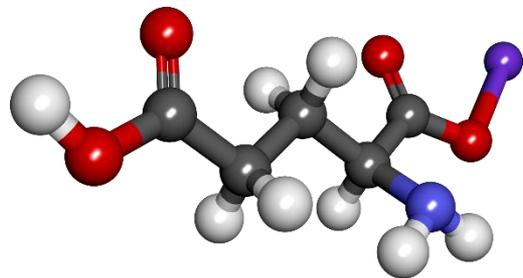

**Saft CE is powering devices within a wide applications' domain**

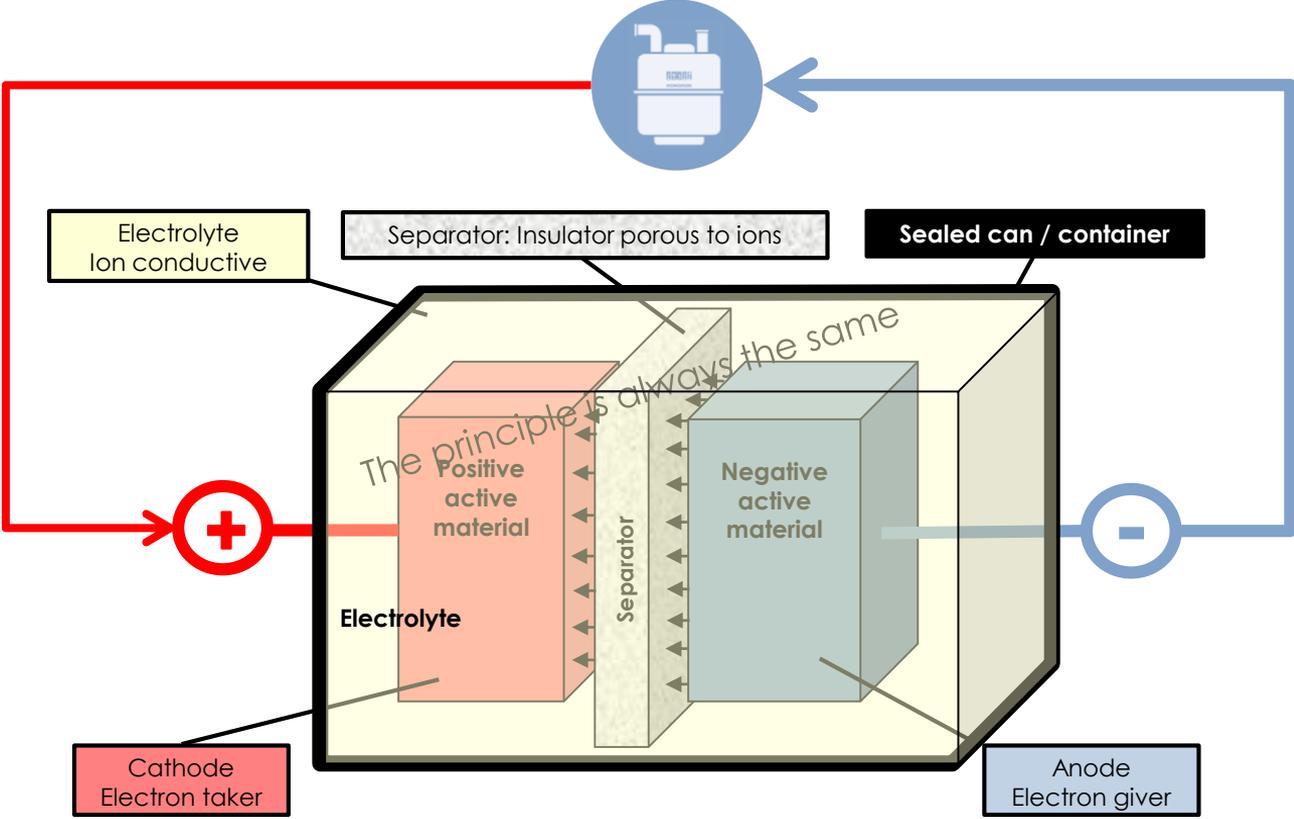

# BATTERIES: A VAST WORLD

# What is a battery ?

# What is a battery ?

# Many different shapes

## – Single cells

- Cylindrical
- Prismatic
- Button/Coin
- Pouch

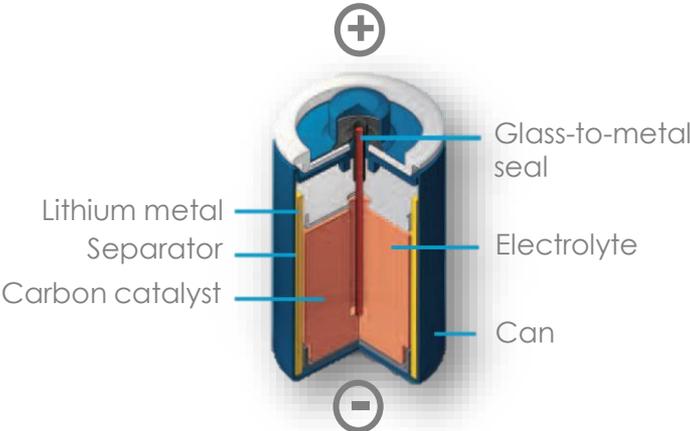

## – Battery packs (multiple cells)

- Serial connection
- Parallel connection
- Serial – parallel connection

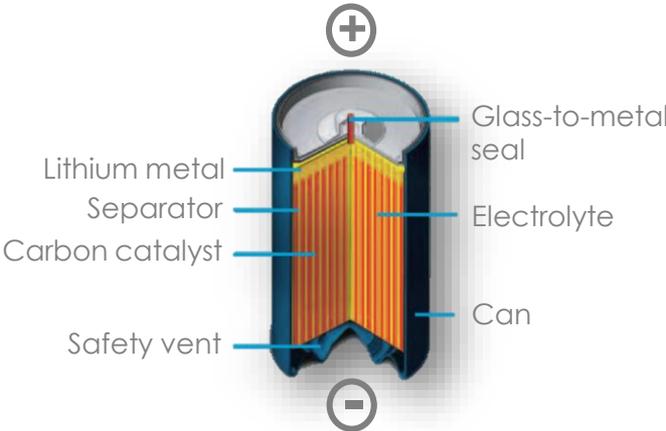

# And different internal constructions too !

## Ex of Lithium Thionyl Chloride cells

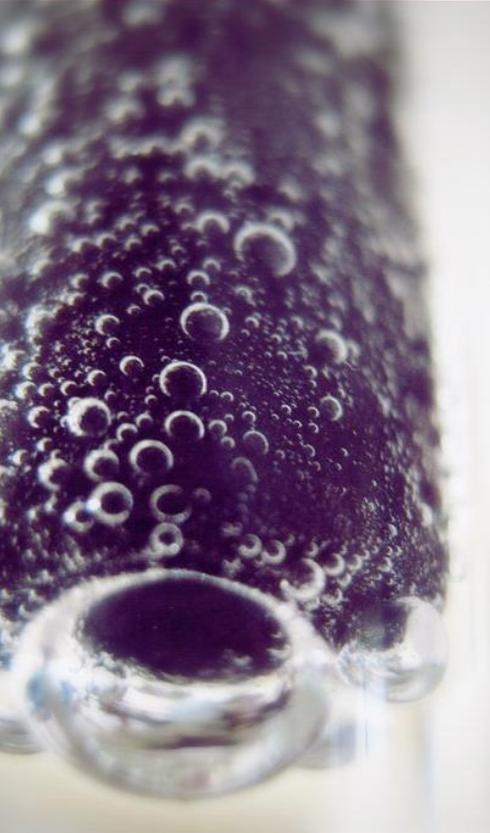

**Bobbin construction**  
(High energy cells)

**Spiral construction**  
(High power cells)

# Basics in electrochemistry

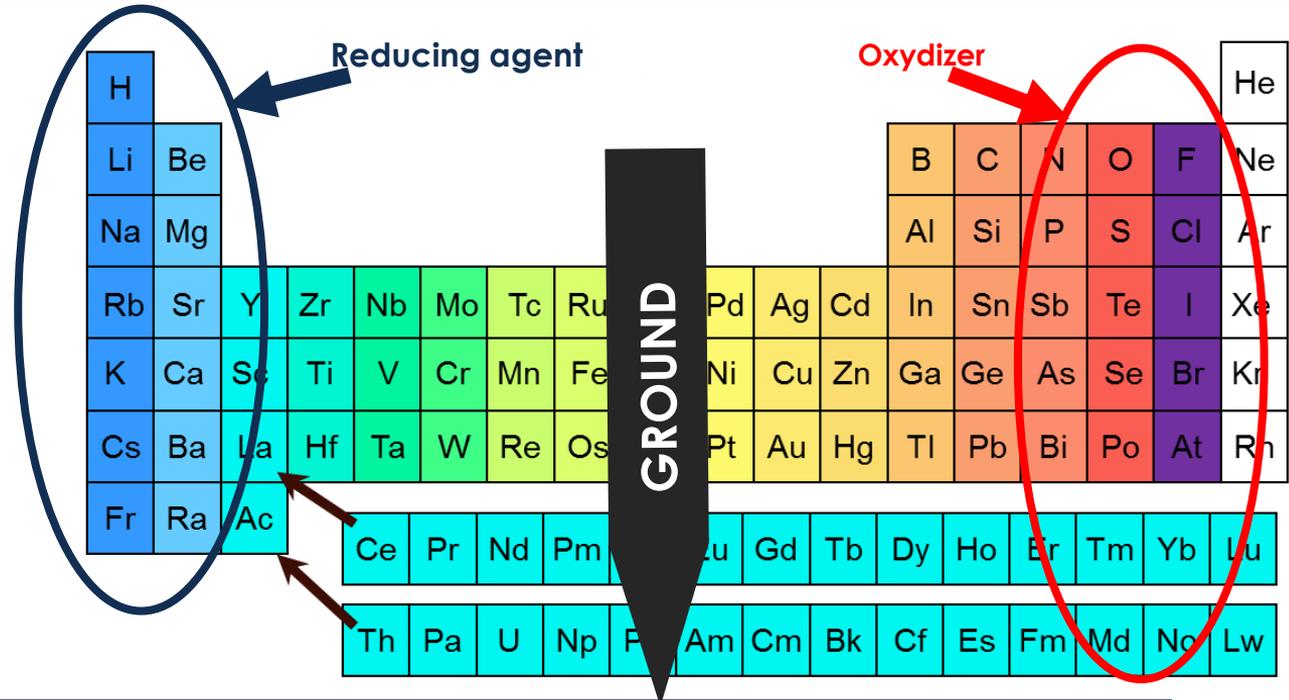

- In an electrochemical generator
  - Voltage, current, load of the application drive chemical reaction
  - Energy produced is electricity
- The electrochemical reaction
  - Chemical reaction inside generator due to electrons exchange
    - Oxydizer: electron taker
    - Reducing agent: electron giver
  - Electrons are used through electrical current outside generator

# Why are lithium-based technologies so popular ?

- Nominal voltage of the cell depends on electrochemical couple

- **Li-ion : 3.7 V**
- Ni-MH: 1.25 V
- Ni-Cd: 1.25 V
- **Li-SOCl<sub>2</sub> : 3.6 V**
- **Li-MnO<sub>2</sub> : 3 V**
- Alkaline 1.5 V

High nominal voltage is important to electronics applications

# Most common battery chemistries

## Rechargeable

- **Lead acid** (2 V nominal voltage)
  - Low price, heavy, still highly used in industrial environments (forklift trucks, UPS, backup batteries...). Short life compared to other types
- **Nickel-Cadmium** (Ni-Cd, 1.25 V nominal voltage)
  - Medium price, used in lead acid replacement as Total Cost of Ownership is better
- **Nickel-Metal-Hydrate** (Ni-MH, 1.25 V nominal voltage)
  - Higher energy density than Ni-Cd.
- **Lithium-ion** (3.7 V nominal voltage)
  - Designation of many different chemistries: NCA, NMC, FePO<sub>4</sub>... with various characteristics. Needs a more sophisticated battery management than other types. Most popular form factor was 18650 cylindrical types, used in laptop
- **Li-ion Polymer** (3.7 V nominal voltage)
  - Same as lithium-ion but in soft casing (vs 18650) with a different electrolyte, used in mobile phones, tablets, thin laptops,

## Non rechargeable (primary)

- **Alkaline** (1.5 V nominal voltage)
  - Consumer type, hi
- **Lithium Iron Disulfide** (Li-FeS<sub>2</sub>, 1.5 V nominal voltage)
  - Was used in replacement of alkaline cells
- **Lithium Manganese Dioxide** (Li-MnO<sub>2</sub>, 3 V nominal voltage)
  - Exists in consumer grades (cameras...) and industrial. High power and good voltage response to pulse
- **Lithium Sulfur Dioxide** (Li-SO<sub>2</sub>, 2.8 V nominal voltage)
  - For military use and medical (defibrillators): high power cells, very good in cold environments
- **Lithium Carbon monofluoride** (Li-CF<sub>x</sub>, 3 V nominal voltage)
  - High temp cells, for special applications
- **Lithium Thionyl Chloride** (Li-SOCl<sub>2</sub>, 3.6 V nominal voltage)
  - Adopted by smart metering, IoT applications (and historically, by military equipment applications). Very wide range of temperatures (-60°C to +85°C and more for some cells)

With high energy densities, low self-discharge, stable voltage, lithium primary batteries are a good match with IoT needs for long life and standalone solutions

# Do Lithium rechargeable batteries last longer than primary ones ?

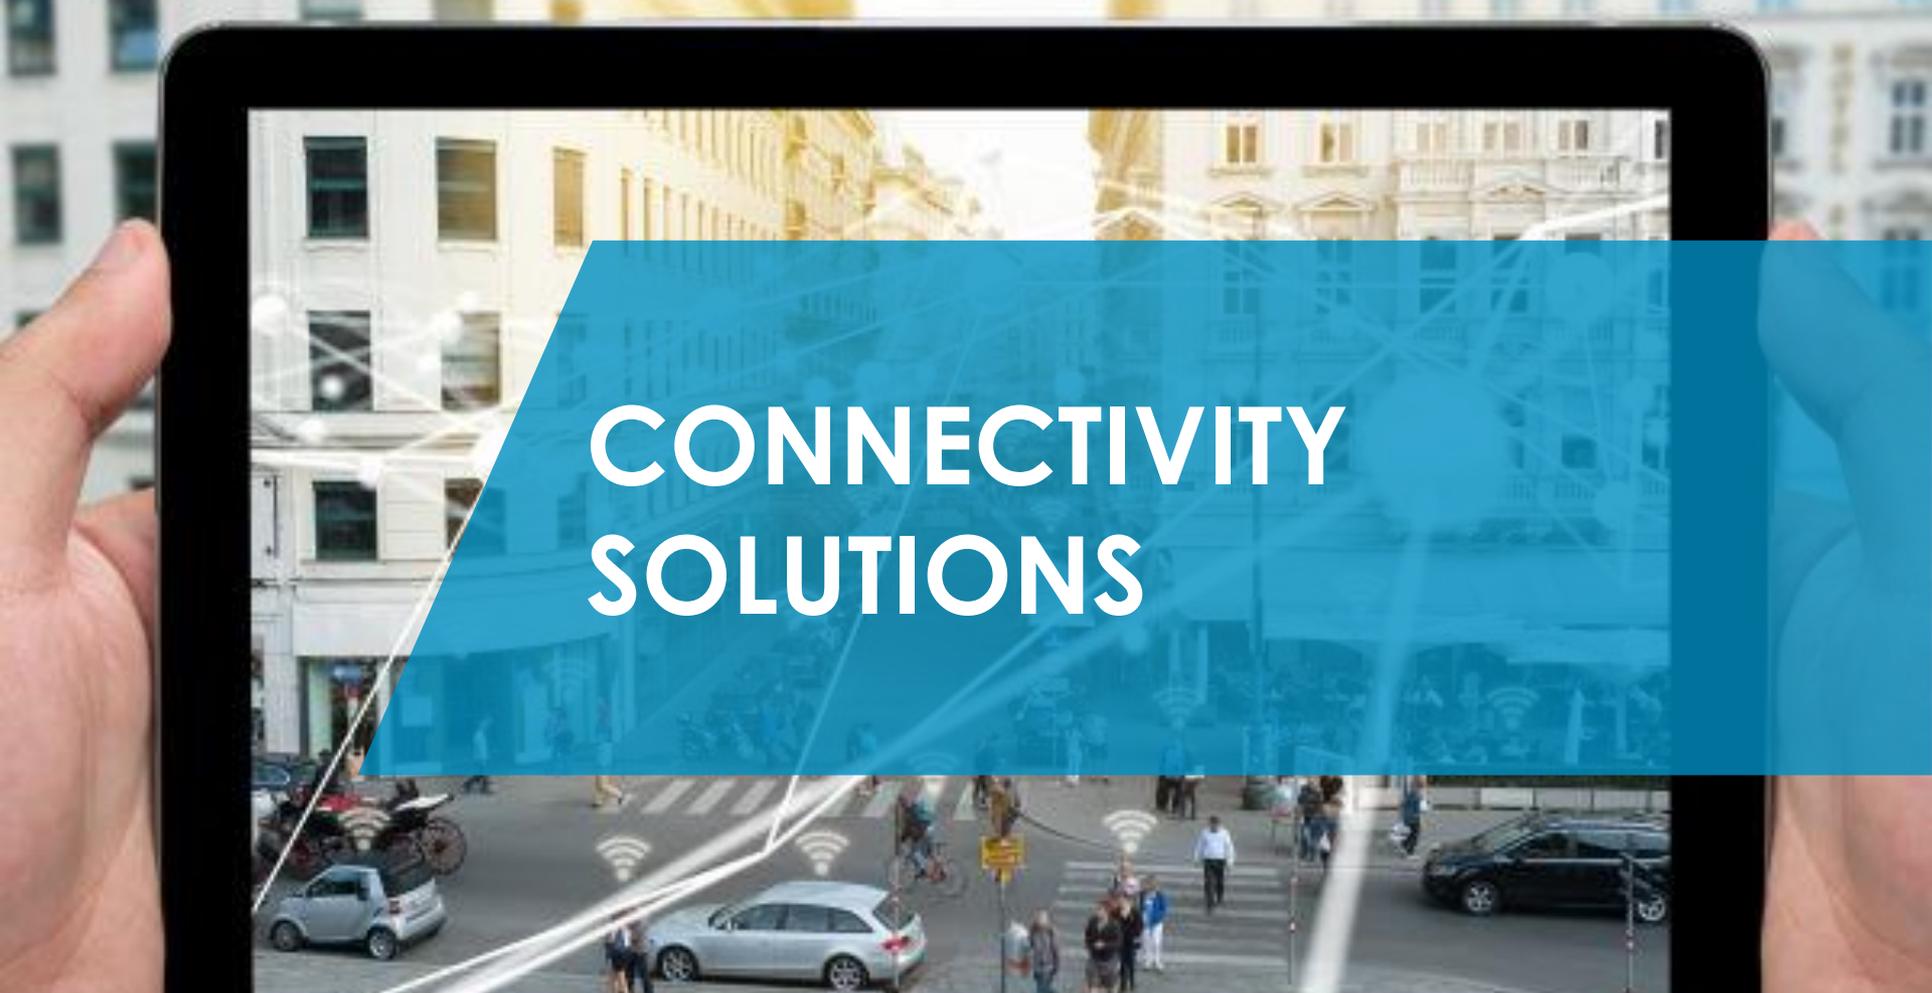

## Rechargeable Lithium

- Cycle life
- Medium to high discharge rates (A)
- Medium self discharge
- Generally from -20°C to +60°C
- Need of an external energy source for charging & of a battery management system

## Non rechargeable Lithium (primary)

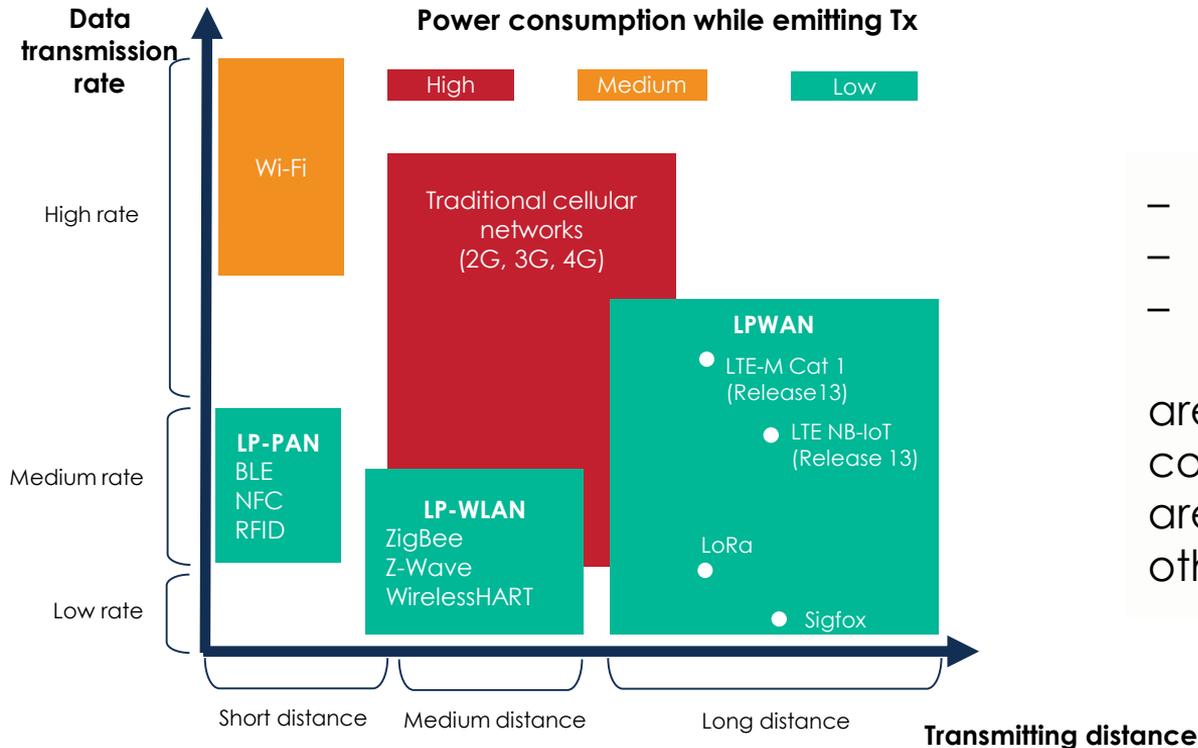

- Fit & forget solutions
- Low to medium discharge rates (from  $\mu\text{A}$  to a few A)
- Very low self discharge (ca 1% per yr at 20°C)
- Wide temperature ranges (-60°C up to +85°C or more)
- Standalone applications

Non rechargeable doesn't mean consumer grade  
Single use doesn't mean "must be replaced"

# CONNECTIVITY SOLUTIONS

# Connectivity solutions : 3 impacting factors

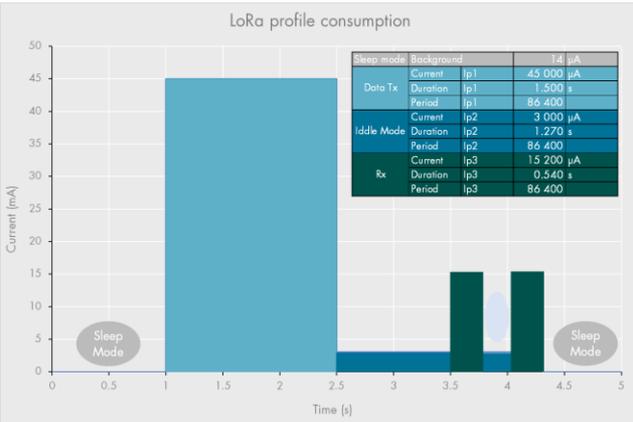

- **Data transmission rate**
- **Transmitting distance**
- **Power consumption**

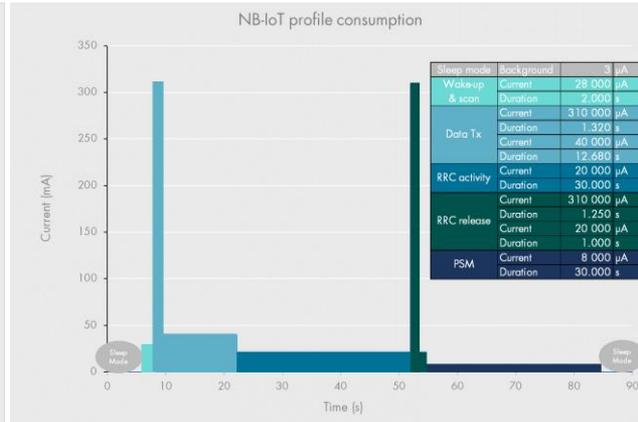

are key features of a connectivity solution and are impacting each other

# LPWAN protocols typical profiles

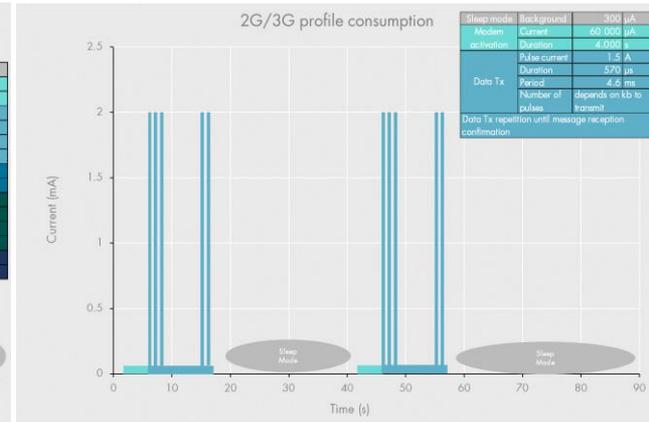

## What is the yearly consumption for one transmission / day ?

**LoRaWAN: ca. 130 mAh**  
For 10 yrs: AA or A size cell

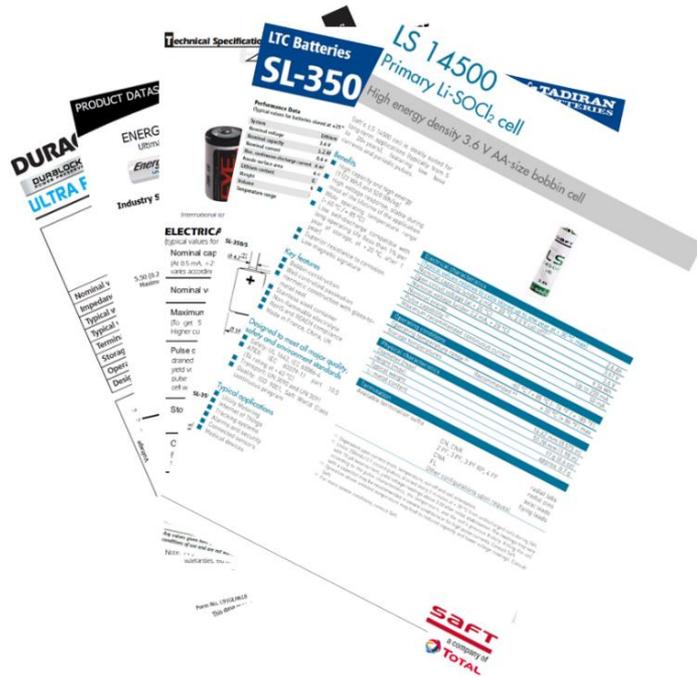

**NB-IoT LTE-M: 250 to 300 mAh**  
A, C or D size cell

**2G/3G > 4000 mAh**  
Complex solution: Multi D size

**Traditional cellular connectivity is more compatible with Li-ion technologies**

# Battery Data sheet

## What's in Batteries' data sheets ?

- Nominal Voltage
- Operating Temperature range
- Nominal Capacity
- Maximum Continuous Current
- Maximum Pulse Capability

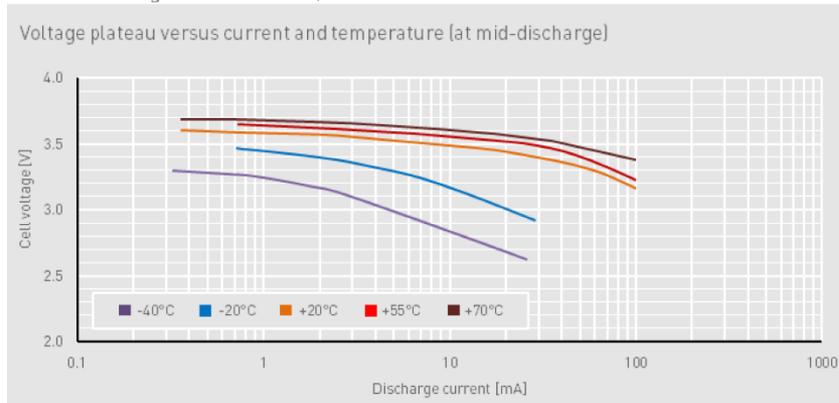

## How to properly use this information ?

# VOLTAGE SELECTION

# Cell voltage vs discharge current curve

Open circuit voltage (at + 20 °C) 3.67 V  
Nominal voltage (under 0.2 mA, + 20 °C) 3.6 V

## Datasheet's information

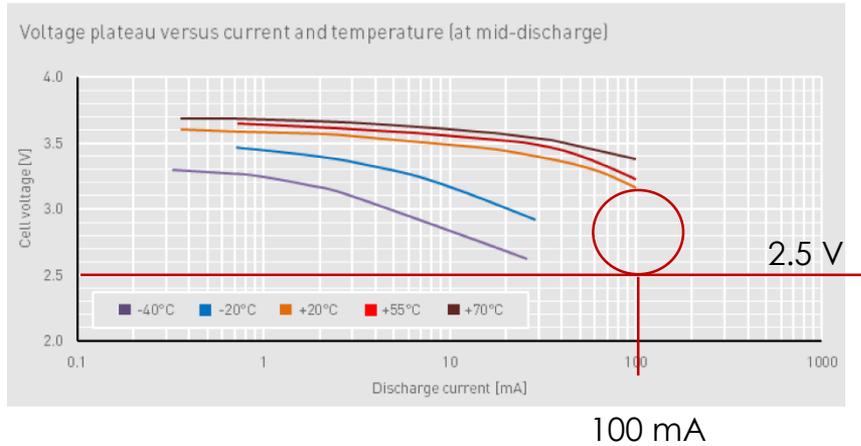

- Open Circuit Voltage
- Nominal Voltage
- Voltage Plateau

**Batteries are NOT Constant Voltage Generators !!!!!**

# Check the battery voltage compatibility with your usage

## Ex of device's characteristics

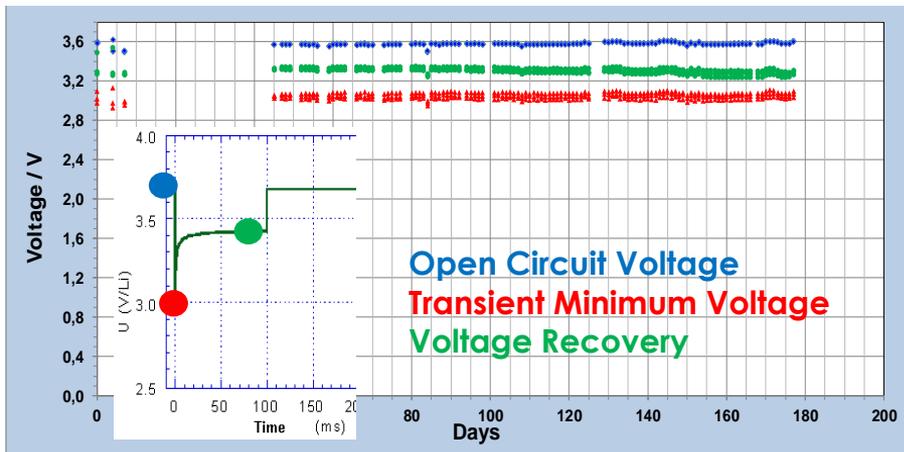

- Minimum Operating Voltage = 2.5 V
- Minimum Operating Temperature = -20°C
- Data Tx Maximum Peak Current > 100 mA

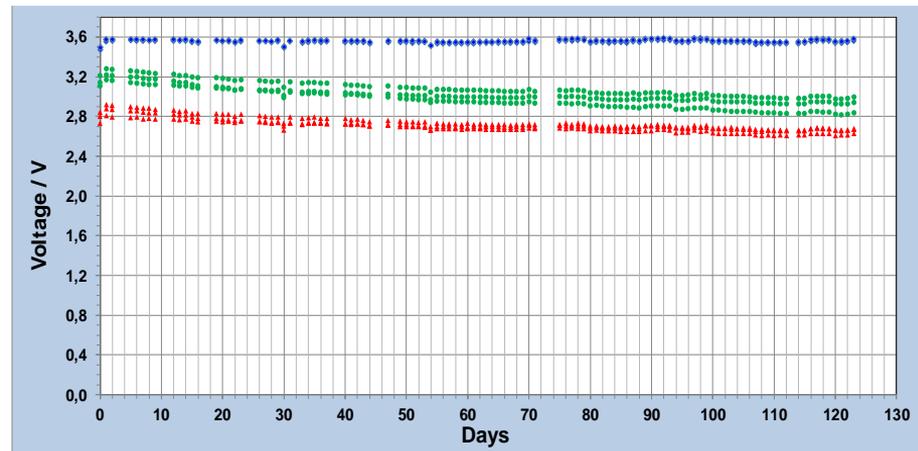

Data is not available for this voltage level -> testing is required

# Example of Li-SOCl<sub>2</sub> AA size cell behavior under current pulse (100 mA)

## Fresh cells

## Cells artificially aged (1-month storage at 70°C)

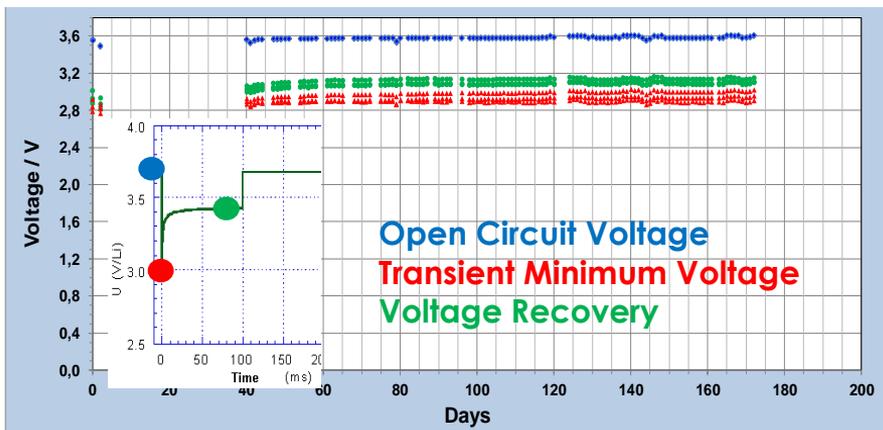

Even when “aged” cells, a long period of testing might be necessary

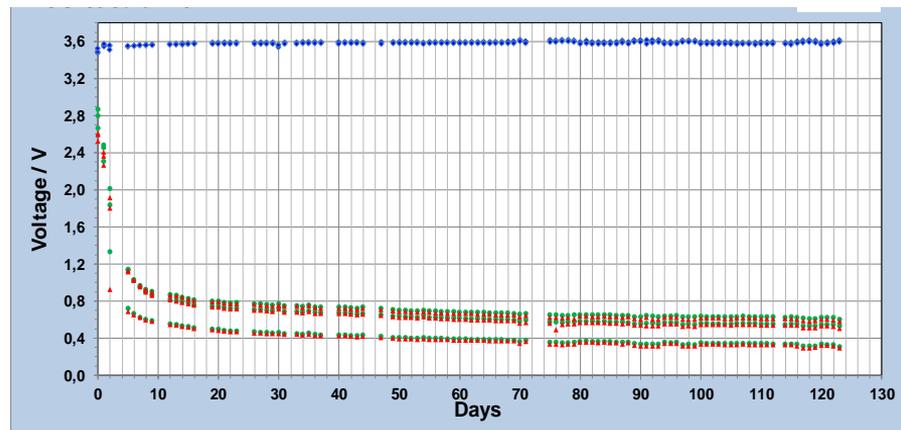

# Example of Li-SOCl<sub>2</sub> AA size cell behavior under current pulse (100 mA)

WORST CASE

## Fresh cells

## Cells artificially aged (1-month storage at +70°C)

For some cells, you may observe depletive voltage response earlier

# What are your options ?

## Construction, chemistry, configuration

- Bobbin cells vs Spiral cells
  - To be checked: temperature and cut off voltage
- Addition of a booster (EDLC, Supercapacitor, Hybrid Capacitor, DC/DC Converter) ?
  - To be checked: leakage current, internal resistance, temperature range
- Select another electrochemical system such as Li-MnO<sub>2</sub>
  - To be checked: cut-off voltage and temperature
- Complex configuration with several cells in parallel and series

**Battery manufacturers can support you !**

# What are Saft's solutions compatible with LPWAN needs ?

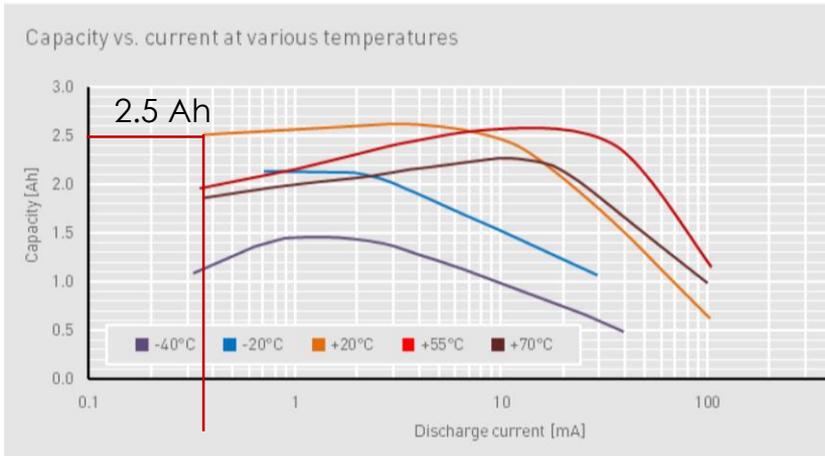

Pulse application solutions LSH, M/LM and LSP: up to 2 – 3 A pulse

# CAPACITY SELECTION

# Capacity vs discharge rate curve

ca. 350  $\mu$ A

## Ex of device's characteristics

- Total device consumption = 2000 mAh
- Data Tx Maximum Peak Current 100 mA
- Consumption mainly in Sleep Mode / PSM < 10  $\mu$ A

## NO DATA for search discharge rate !

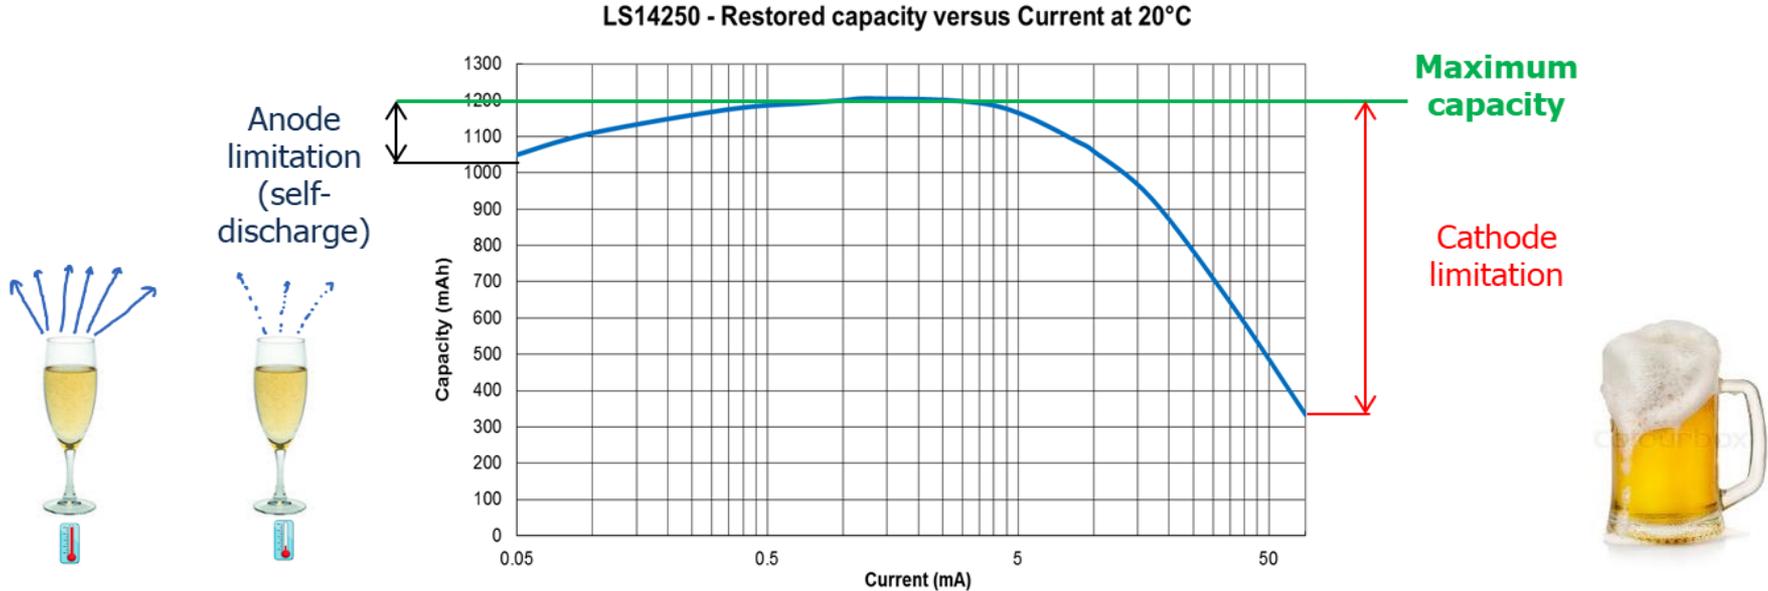

A 2.5 Ah cell under 10  $\mu$ A discharge rate with 1 % capacity self discharge / year

= discharge time > 15 years !

**No data for very low discharge rate: testing time is not realistic**

# Influence of discharge rate on Useful Capacity

## Anode vs Cathode limitation

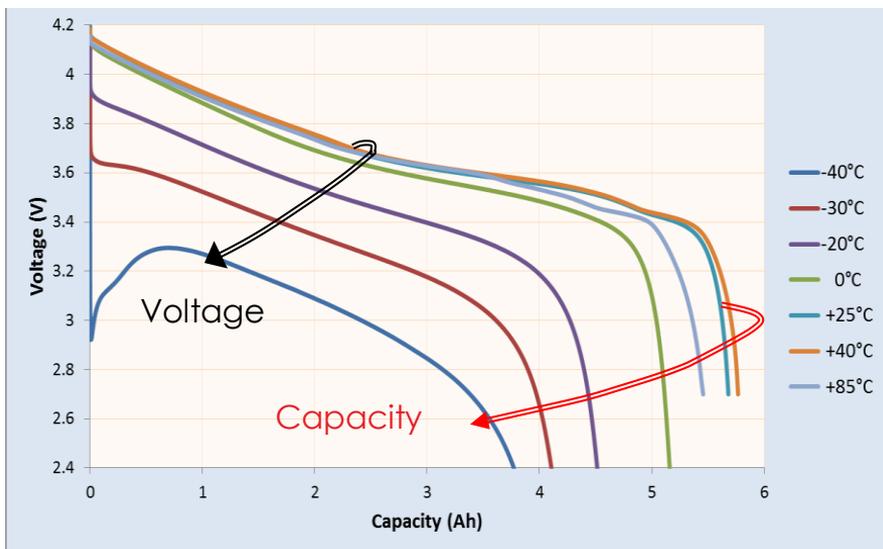

There is a range of discharge rates for which the efficiency is maximal

# OPERATING TEMPERATURE SELECTION

# Temperature effect on electrochemical system

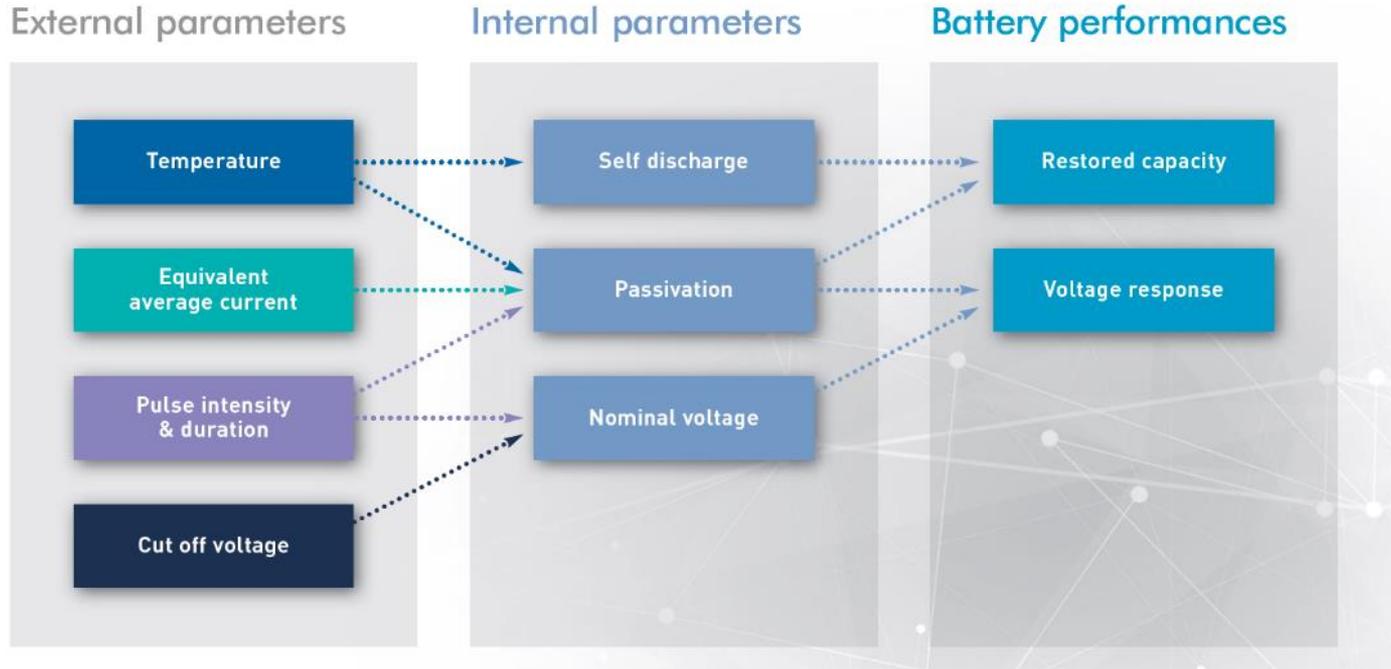

## Temperature has the strongest impact of performances

- Low temperature
  - **slows down** the electrochemistry reactions
  - **increase the internal resistance**
- High temperature
  - **increases self-discharge**
  - **generates passivation** on liquid cathode system

**Both restored capacity and voltage response are impacted**

# When using a non rechargeable battery...

Selecting the right chemistry, size and configuration is key to achieve your goal

# BEYOND R&D... POINTS OF ATTENTION

# Battery Integration: to be considered at early stage

---

## Technical possibilities

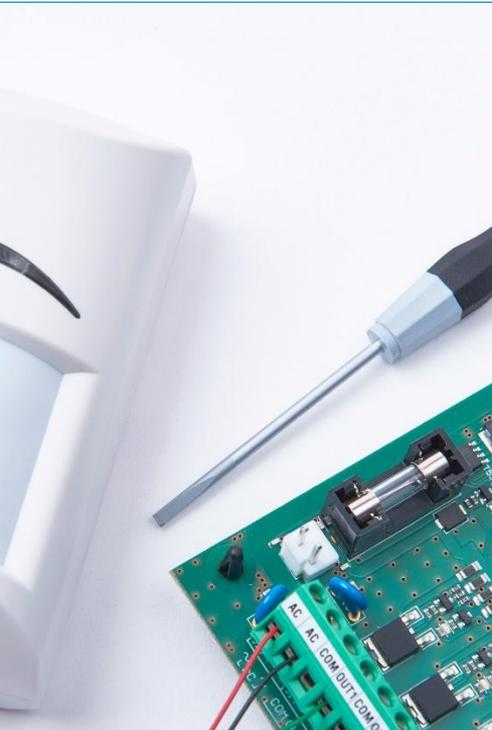

### ~~Battery Holder~~

- Welded on PCB
- Wires and Connector

## Industrial and Reliable Application

- Welded on PCB
- Wires and Connector

# What are the applicable Standards for your device ?

## Device Standards Example

IEC 62368-1:2018: Audio/video, information and communication technology equipment - Part 1: Safety requirements

- Protections have to be added at device level
- Batteries have to be tested under device component failure modes

**Applicable Standards can impact Battery Selection**

# Battery Safety Standards

Safety Standards	Primary Cell	Rechargeable Cell
UN 38.3 (Transport)	✓	✓
UL 1642 (Safety)	✓	✓
IEC 60086-4 (Safety)	✓	
IEC 62133 Ed2 (Safety)		✓
IEC 60079-11 (ATEX)	✓	✓

# Battery Transportation

## Lithium Batteries are Dangerous Goods !!!!!

- Under which conditions can I transport my device with battery inside ?
- How can I manage Battery Spare Parts for replacement ?
- How can I manage End of life Batteries (Disposal & Recycling) ?

Worldwide Rules & National Regulations to be checked (and respected)

## 5 takeaways

---

- **Non rechargeable batteries may last longer than rechargeable**
  - With their high nominal voltage, lithium primary solutions match many IoT cases
- **Choice of connectivity has a huge impact on battery solution**
  - Traditional cellular connectivity may lead to complex battery solution
- **Knowing accurately the device's consumption is important**
  - Max peak current, average current, Cut off voltage impact battery's efficiency
- **Knowing accurately the device's environment is key**
  - Temperature impacts battery's capacity and voltage response
- **There is no one size fits all solution**
  - Ask for a customized support

**Thanks for your attention !**
